

# Package ‘AzureVM’

November 3, 2019

**Title** Virtual Machines in 'Azure'

**Version** 2.1.0

**Description** Functionality for working with virtual machines (VMs) in Microsoft's 'Azure' cloud: <<https://azure.microsoft.com/en-us/services/virtual-machines/>>. Includes facilities to deploy, startup, shutdown, and cleanly delete VMs and VM clusters. Deployment configurations can be highly customised, and can make use of existing resources as well as creating new ones. A selection of predefined configurations is provided to allow easy deployment of commonly used Linux and Windows images, including Data Science Virtual Machines. With a running VM, execute scripts and install optional extensions. Part of the 'AzureR' family of packages.

**URL** <https://github.com/Azure/AzureVM> <https://github.com/Azure/AzureR>

**BugReports** <https://github.com/Azure/AzureVM/issues>

**License** MIT + file LICENSE

**VignetteBuilder** knitr

**Depends** R (>= 3.3)

**Imports** R6, AzureRMR (>= 2.3.0), jsonlite

**Suggests** knitr, testthat, AzureKeyVault, AzureVMmetadata

**RoxygenNote** 6.1.1

**NeedsCompilation** no

**Author** Hong Ooi [aut, cre],  
Microsoft [cph]

**Maintainer** Hong Ooi <[hongooi@microsoft.com](mailto:hongooi@microsoft.com)>

**Repository** CRAN

**Date/Publication** 2019-11-03 09:00:02 UTC

autoscaler_config	<i>Autoscaler configuration</i>
-------------------	---------------------------------

---

## Description

Autoscaler configuration

## Usage

```
autoscaler_config(profiles = list(autoscaler_profile()), ...)
```

```
autoscaler_profile(name = "Profile", minsize = 1, maxsize = NA,
  default = NA, scale_out = 0.75, scale_in = 0.25,
  interval = "PT1M", window = "PT5M")
```

## Arguments

profiles	A list of autoscaling profiles, each obtained via a call to autoscaler_profile.
...	Other named arguments that will be treated as resource properties.
name	For autoscaler_profile, a name for the profile.
minsize, maxsize, default	For autoscaler_profile, the minimum, maximum and default number of instances.

scale_out, scale_in	For autoscaler_profile, the CPU usage (a fraction between 0 and 1) at which to scale out and in, respectively.
interval	For autoscaler_profile, The interval between samples, in ISO 8601 format. The default is 1 minute.
window	For autoscaler_profile, the window width over which to compute the percentage CPU. The default is 5 minutes.

**See Also**

[create\\_vm\\_scaleset](#), [vmss\\_config](#)

**Examples**

```
autoscaler_config()
autoscaler_config(list(
  autoscaler_profile(minsize=2, maxsize=50, scale_out=0.9, scale_in=0.1)
))
```

---

az_vmss_resource	<i>Virtual machine scaleset resource class</i>
------------------	------------------------------------------------

---

**Description**

Class representing a virtual machine scaleset resource. In general, the methods in this class should not be called directly, nor should objects be directly instantiated from it. Use the `az_vmss_template` class for interacting with scalesets instead.

**Usage**

```
az_vmss_resource
```

**Format**

An R6 object of class `az_vmss_resource`, inheriting from `AzureRMR::az_resource`.

**Details**

A single virtual machine scaleset in Azure is actually a collection of resources, including any and all of the following.

- Network security group (Azure resource type `Microsoft.Network/networkSecurityGroups`)
- Virtual network (Azure resource type `Microsoft.Network/virtualNetworks`)
- Load balancer (Azure resource type `Microsoft.Network/loadBalancers`)
- Public IP address (Azure resource type `Microsoft.Network/publicIPAddresses`)
- Autoscaler (Azure resource type `Microsoft.Insights/autoscaleSettings`)
- The scaleset itself (Azure resource type `Microsoft.Compute/virtualMachineScaleSets`)

By wrapping the deployment template used to create these resources, the `az_vmss_template` class allows managing them all as a single entity.

## Methods

The following methods are available, in addition to those provided by the [AzureRMR::az\\_template](#) class.

- `sync_vmss_status`: Check the status of the scaleset.
- `list_instances()`: Return a list of [az\\_vm\\_resource](#) objects, one for each VM instance in the scaleset. Note that if the scaleset has a load balancer attached, the number of instances will vary depending on the load.
- `get_instance(id)`: Return a specific VM instance in the scaleset.
- `start(id=NULL, wait=FALSE)`: Start the scaleset. In this and the other methods listed here, `id` can be an optional character vector of instance IDs; if supplied, only carry out the operation for those instances.
- `restart(id=NULL, wait=FALSE)`: Restart the scaleset.
- `stop(deallocate=TRUE, id=NULL, wait=FALSE)`: Stop the scaleset.
- `get_public_ip_address()`: Get the public IP address of the scaleset (technically, of the load balancer). If the scaleset doesn't have a load balancer attached, returns NA.
- `get_vm_public_ip_addresses(id=NULL, nic=1, config=1)`: Get the public IP addresses for the instances in the scaleset. Returns NA for the instances that are stopped or not publicly accessible.
- `get_vm_private_ip_addresses(id=NULL, nic=1, config=1)`: Get the private IP addresses for the instances in the scaleset.
- `get_vnet(nic=1, config=1)`: Get the scaleset's virtual network resource.
- `get_nsg(nic=1, config=1)`: Get the scaleset's network security group resource.
- `run_deployed_command(command, parameters=NULL, script=NULL, id=NULL)`: Run a PowerShell command on the instances in the scaleset.
- `run_script(script, parameters=NULL, id=NULL)`: Run a script on the VM. For a Linux VM, this will be a shell script; for a Windows VM, a PowerShell script. Pass the script as a character vector.
- `reimage(id=NULL, datadisks=FALSE)`: Reimage the instances in the scaleset. If `datadisks` is TRUE, reimage any attached data disks as well.
- `redeploy(id=NULL)`: Redeploy the instances in the scaleset.
- `mapped_vm_operation(..., id=NULL)`: Carry out an arbitrary operation on the instances in the scaleset. See the `do_operation` method of the [AzureRMR::az\\_resource](#) class for more details.
- `add_extension(publisher, type, version, settings=list(), protected_settings=list(), key_vault_setting=)`: Add an extension to the scaleset.
- `do_vmss_operation(...)`: Carry out an arbitrary operation on the scaleset resource (as opposed to the instances in the scaleset).

## Instance operations

AzureVM has the ability to parallelise scaleset instance operations using a background process pool provided by AzureRMR. This can lead to significant speedups when working with scalesets

with high instance counts. The pool is created automatically the first time that it is required, and remains persistent for the session. You can control the size of the process pool with the `azure_vm_minpoolsize` and `azure_vm_maxpoolsize` options, which have default values 2 and 10 respectively.

The `id` argument lets you specify a subset of instances on which to carry out an operation. This can be a character vector of instance IDs; a list of instance objects such as returned by `list_instances`; or a single instance object. The default (NULL) is to carry out the operation on all instances.

---

az_vmss_template	<i>Virtual machine scaleset (cluster) template class</i>
------------------	----------------------------------------------------------

---

### Description

Class representing a virtual machine scaleset deployment template. This class keeps track of all resources that are created as part of deploying a scaleset, and exposes methods for managing them.

### Usage

```
az_vmss_template
```

### Format

An R6 object of class `az_vmss_template`, inheriting from `AzureRMR::az_template`.

### Details

A virtual machine scaleset in Azure is actually a collection of resources, including any and all of the following.

- Network security group (Azure resource type `Microsoft.Network/networkSecurityGroups`)
- Virtual network (Azure resource type `Microsoft.Network/virtualNetworks`)
- Load balancer (Azure resource type `Microsoft.Network/loadBalancers`)
- Public IP address (Azure resource type `Microsoft.Network/publicIPAddresses`)
- Autoscaler (Azure resource type `Microsoft.Insights/autoscaleSettings`)
- The scaleset itself (Azure resource type `Microsoft.Compute/virtualMachineScaleSets`)

By wrapping the deployment template used to create these resources, the `az_vmss_template` class allows managing them all as a single entity.

## Fields

The following fields are exposed, in addition to those provided by the [AzureRMR::az\\_template](#) class.

- `dns_name`: The DNS name for the scaleset (technically, the name for its load balancer). Will be NULL if the scaleset is not publicly visible, or doesn't have a load balancer attached.
- `identity`: The managed identity details for the scaleset. Will be NULL if the scaleset doesn't have an identity assigned.

## Methods

The following methods are available, in addition to those provided by the [AzureRMR::az\\_template](#) class.

- `sync_vmss_status`: Check the status of the scaleset.
- `list_instances()`: Return a list of [az\\_vm\\_resource](#) objects, one for each VM instance in the scaleset. Note that if the scaleset has an autoscaler attached, the number of instances will vary depending on the load.
- `get_instance(id)`: Return a specific VM instance in the scaleset.
- `start(id=NULL, wait=FALSE)`: Start the scaleset. In this and the other methods listed here, `id` can be an optional character vector of instance IDs; if supplied, only carry out the operation for those instances.
- `restart(id=NULL, wait=FALSE)`: Restart the scaleset.
- `stop(deallocate=TRUE, id=NULL, wait=FALSE)`: Stop the scaleset.
- `get_public_ip_address()`: Get the public IP address of the scaleset (technically, of the load balancer). If the scaleset doesn't have a load balancer attached, returns NA.
- `get_vm_public_ip_addresses(id=NULL, nic=1, config=1)`: Get the public IP addresses for the instances in the scaleset. Returns NA for the instances that are stopped or not publicly accessible.
- `get_vm_private_ip_addresses(id=NULL, nic=1, config=1)`: Get the private IP addresses for the instances in the scaleset.
- `get_public_ip_resource()`: Get the Azure resource for the load balancer's public IP address.
- `get_vnet(nic=1, config=1)`: Get the scaleset's virtual network resource.
- `get_nsg(nic=1, config=1)`: Get the scaleset's network security group resource.
- `get_load_balancer()`: Get the scaleset's load balancer resource.
- `get_autoscaler()`: Get the scaleset's autoscaler resource.
- `run_deployed_command(command, parameters=NULL, script=NULL, id=NULL)`: Run a PowerShell command on the instances in the scaleset.
- `run_script(script, parameters=NULL, id=NULL)`: Run a script on the VM. For a Linux VM, this will be a shell script; for a Windows VM, a PowerShell script. Pass the script as a character vector.
- `reimage(id=NULL, datadisks=FALSE)`: Reimage the instances in the scaleset. If `datadisks` is TRUE, reimage any attached data disks as well.

- `redeploy(id=NULL)`: Redeploy the instances in the scaleset.
- `mapped_vm_operation(..., id=NULL)`: Carry out an arbitrary operation on the instances in the scaleset. See the `do_operation` method of the [AzureRMR::az\\_resource](#) class for more details.
- `add_extension(publisher, type, version, settings=list(), protected_settings=list(), key_vault_setting=...)`: Add an extension to the scaleset.
- `do_vmss_operation(...)`: Carry out an arbitrary operation on the scaleset resource (as opposed to the instances in the scaleset).

Many of these methods are actually provided by the [az\\_vmss\\_resource](#) class, and propagated to the template as active bindings.

### Instance operations

AzureVM has the ability to parallelise scaleset instance operations using a background process pool provided by AzureRMR. This can lead to significant speedups when working with scalesets with high instance counts. The pool is created automatically the first time that it is required, and remains persistent for the session. You can control the size of the process pool with the `azure_vm_minpoolsize` and `azure_vm_maxpoolsize` options, which have default values 2 and 10 respectively.

The `id` argument lets you specify a subset of instances on which to carry out an operation. This can be a character vector of instance IDs; a list of instance objects such as returned by `list_instances`; or a single instance object. The default (NULL) is to carry out the operation on all instances.

### Examples

```
## Not run:

sub <- AzureRMR::get_azure_login()$
  get_subscription("subscription_id")

vmss <- sub$get_vm_scaleset("myscaleset")

vmss$identity

vmss$get_public_ip_address() # NA if the scaleset doesn't have a load balancer

vmss$start()
vmss$get_vm_private_ip_addresses()
vmss$get_vm_public_ip_addresses() # NA if scaleset nodes are not publicly visible

instances <- vmss$list_instances()
first <- instances[1]
vmss$run_script("echo hello world! > /tmp/hello.txt", id=first)
vmss$stop(id=first)
```

```

vmss$reimage(id=first)

vmss$sync_vmss_status()

## End(Not run)

```

---

az_vm_resource	<i>Virtual machine resource class</i>
----------------	---------------------------------------

---

## Description

Class representing a virtual machine resource. In general, the methods in this class should not be called directly, nor should objects be directly instantiated from it. Use the `az_vm_template` class for interacting with VMs instead.

## Usage

```
az_vm_resource
```

## Format

An R6 object of class `az_vm_resource`, inheriting from `AzureRMR::az_resource`.

## Methods

The following methods are available, in addition to those provided by the [AzureRMR::az\\_resource](#) class:

- `start(wait=TRUE)`: Start the VM. By default, wait until the startup process is complete.
- `stop(deallocate=TRUE, wait=FALSE)`: Stop the VM. By default, deallocate it as well.
- `restart(wait=TRUE)`: Restart the VM.
- `run_deployed_command(command, parameters, script)`: Run a PowerShell command on the VM.
- `run_script(script, parameters)`: Run a script on the VM. For a Linux VM, this will be a shell script; for a Windows VM, a PowerShell script. Pass the script as a character vector.
- `sync_vm_status()`: Check the status of the VM.
- `resize(size, deallocate=FALSE, wait=FALSE)`: Resize the VM. Optionally stop and deallocate it first (may sometimes be necessary).
- `redeploy()`: Redeploy the VM.
- `reimage()`: Reimage the VM.
- `get_public_ip_address(nic=1, config=1)`: Get the public IP address of the VM. Returns NA if the VM is shut down, or is not publicly accessible.
- `get_private_ip_address(nic=1, config=1)`: Get the private IP address of the VM.

- `get_public_ip_resource(nic=1,config=1)`: Get the Azure resource for the VM's public IP address.
- `get_nic(nic=1)`: Get the VM's network interface resource.
- `get_vnet(nic=1,config=1)`: Get the VM's virtual network resource.
- `get_nsg(nic=1,config=1)`: Get the VM's network security group resource. Note that an NSG can be attached to either the VM's network interface or to its virtual network subnet; if there is an NSG attached to both, this method returns a list containing the two NSG resource objects.
- `get_disk(disk="os")`: Get a managed disk resource attached to the VM. The disk argument can be "os" for the OS disk, or a number indicating the LUN of a data disk. AzureVM only supports managed disks.
- `add_extension(publisher, type, version, settings=list(), protected_settings=list(), key_vault_setting=...)`: Add an extension to the VM.
- `do_vm_operation(...)`: Carry out an arbitrary operation on the VM resource. See the `do_operation` method of the [AzureRMR::az\\_resource](#) class for more details.

az_vm_template	<i>Virtual machine template class</i>
----------------	---------------------------------------

---

### Description

Class representing a virtual machine deployment template. This class keeps track of all resources that are created as part of deploying a VM, and exposes methods for managing them.

### Usage

```
az_vm_template
```

### Format

An R6 object of class `az_vm_template`, inheriting from `AzureRMR::az_template`.

### Details

A single virtual machine in Azure is actually a collection of resources, including any and all of the following.

- Network interface (Azure resource type `Microsoft.Network/networkInterfaces`)
- Network security group (Azure resource type `Microsoft.Network/networkSecurityGroups`)
- Virtual network (Azure resource type `Microsoft.Network/virtualNetworks`)

- Public IP address (Azure resource type `Microsoft.Network/publicIPAddresses`)
- The VM itself (Azure resource type `Microsoft.Compute/virtualMachines`)

By wrapping the deployment template used to create these resources, the `az_vm_template` class allows managing them all as a single entity.

## Fields

The following fields are exposed, in addition to those provided by the [AzureRMR::az\\_template](#) class.

- `dns_name`: The DNS name for the VM. Will be NULL if the VM is not publicly visible, or doesn't have a domain name assigned to its public IP address.
- `identity`: The managed identity details for the VM. Will be NULL if the VM doesn't have an identity assigned.

## Methods

The following methods are available, in addition to those provided by the [AzureRMR::az\\_template](#) class.

- `start(wait=TRUE)`: Start the VM. By default, wait until the startup process is complete.
- `stop(deallocate=TRUE,wait=FALSE)`: Stop the VM. By default, deallocate it as well.
- `restart(wait=TRUE)`: Restart the VM.
- `run_deployed_command(command,parameters,script)`: Run a PowerShell command on the VM.
- `run_script(script,parameters)`: Run a script on the VM. For a Linux VM, this will be a shell script; for a Windows VM, a PowerShell script. Pass the script as a character vector.
- `sync_vm_status()`: Check the status of the VM.
- `resize(size,deallocate=FALSE,wait=FALSE)`: Resize the VM. Optionally stop and deallocate it first (may sometimes be necessary).
- `redeploy()`: Redeploy the VM.
- `reimage()`: Reimage the VM.
- `get_public_ip_address(nic=1,config=1)`: Get the public IP address of the VM. Returns NA if the VM is stopped, or is not publicly accessible.
- `get_private_ip_address(nic=1,config=1)`: Get the private IP address of the VM.
- `get_public_ip_resource(nic=1,config=1)`: Get the Azure resource for the VM's public IP address.
- `get_nic(nic=1)`: Get the VM's network interface resource.
- `get_vnet(nic=1,config=1)`: Get the VM's virtual network resource.
- `get_nsg(nic=1,config=1)`: Get the VM's network security group resource. Note that an NSG can be attached to either the VM's network interface or to its virtual network subnet; if there is an NSG attached to both, this method returns a list containing the two NSG resource objects.

- `get_disk(disk="os")`: Get a managed disk resource attached to the VM. The disk argument can be "os" for the OS disk, or a number indicating the LUN of a data disk. AzureVM only supports managed disks.
- `add_extension(publisher, type, version, settings=list(), protected_settings=list(), key_vault_settings=list())`: Add an extension to the VM.
- `do_vm_operation(...)`: Carries out an arbitrary operation on the VM resource. See the `do_operation` method of the [AzureRMR::az\\_resource](#) class for more details.

Many of these methods are actually provided by the [az\\_vm\\_resource](#) class, and propagated to the template as active bindings.

### Examples

```
## Not run:

sub <- AzureRMR::get_azure_login()$
  get_subscription("subscription_id")

vm <- sub$get_vm("myvm")

vm$identity

vm$start()
vm$get_private_ip_address()
vm$get_public_ip_address()

vm$run_script("echo hello world! > /tmp/hello.txt")

vm$stop()
vm$get_private_ip_address()
vm$get_public_ip_address() # NA, assuming VM has a dynamic IP address

vm$resize("Standard_DS13_v2")
vm$sync_vm_status()

## End(Not run)
```

---

build\_template\_definition.vm\_config

*Build template definition and parameters*

---

**Description**

Build template definition and parameters

**Usage**

```
## S3 method for class 'vm_config'  
build_template_definition(config, ...)  
  
## S3 method for class 'vmss_config'  
build_template_definition(config, ...)  
  
## S3 method for class 'vm_config'  
build_template_parameters(config, name, login_user,  
  size, ...)  
  
## S3 method for class 'vmss_config'  
build_template_parameters(config, name, login_user,  
  size, instances, ...)
```

**Arguments**

<code>config</code>	An object of class <code>vm_config</code> or <code>vmss_config</code> representing a virtual machine or scaleset deployment.
<code>...</code>	Unused.
<code>name</code>	The VM or scaleset name. Will also be used for the domain name label, if a public IP address is included in the deployment.
<code>login_user</code>	An object of class <code>user_config</code> representing the login details for the admin user account on the VM.
<code>size</code>	The VM (instance) size.
<code>instances</code>	For <code>vmss_config</code> , the number of (initial) instances in the VM scaleset.

**Details**

These are methods for the generics defined in the AzureRMR package.

**Value**

Objects of class `json`, which are JSON character strings representing the deployment template and its parameters.

**See Also**

[create\\_vm](#), [vm\\_config](#), [vmss\\_config](#)

## Examples

```
vm <- ubuntu_18.04()
build_template_definition(vm)
build_template_parameters(vm, "myubuntovm",
  user_config("username", "~/ssh/id_rsa.pub"), "Standard_DS3_v2")
```

---

create\_vm

*Create a new virtual machine or scaleset of virtual machines*

---

## Description

Method for the [AzureRMR::az\\_subscription](#) and [AzureRMR::az\\_resource\\_group](#) classes.

## Usage

```
## R6 method for class 'az_resource_group'
create_vm(name, login_user, size = "Standard_DS3_v2", config = "ubuntu_dsvm",
  managed_identity = TRUE, datadisks = numeric(0), ...,
  template, parameters, mode = "Incremental", wait = TRUE)
```

```
## R6 method for class 'az_subscription'
create_vm(name, ..., resource_group = name, location)
```

```
## R6 method for class 'az_resource_group'
create_vm_scaleset(name, login_user, instances, size = "Standard_DS1_v2",
  config = "ubuntu_dsvm_ss", ...,
  template, parameters, mode = "Incremental", wait = TRUE)
```

```
## R6 method for class 'az_subscription'
create_vm_scaleset(name, ..., resource_group = name, location)
```

## Arguments

- `name`: The name of the VM or scaleset.
- `location`: For the subscription methods, the location for the VM or scaleset. Use the `list_locations()` method of the `AzureRMR::az_subscription` class to see what locations are available.
- `resource_group`: For the subscription methods, the resource group in which to place the VM or scaleset. Defaults to a new resource group with the same name as the VM.
- `login_user`: The details for the admin login account. An object of class `user_config`, obtained by a call to the `user_config` function.
- `size`: The VM (instance) size. Use the `list_vm_sizes` method to see what sizes are available.
- `config`: The VM or scaleset configuration. See 'Details' below for how to specify this. The default is to use an Ubuntu Data Science Virtual Machine.

- `managed_identity`: For `create_vm`, whether the VM should have a managed identity attached.
- `datadisks`: Any data disks to attach to the VM or scaleset. See 'Details' below.
- `instances`: For `create_vm_scaleset`, the initial number of instances in the scaleset.
- ... For the subscription methods, any of the other arguments listed here, which will be passed to the resource group method. For the resource group method, additional arguments to pass to the VM/scaleset configuration functions `vm_config` and `vmss_config`. See the examples below.
- `template, parameters`: The template definition and parameters to deploy. By default, these are constructed from the values of the other arguments, but you can supply your own template and/or parameters as well.
- `wait`: Whether to wait until the deployment is complete.
- `mode`: The template deployment mode. If "Complete", any existing resources in the resource group will be deleted.

### Details

These methods deploy a template to create a new virtual machine or scaleset.

The `config` argument can be specified in the following ways:

- As the name of a supplied VM or scaleset configuration, like "ubuntu\_dsvm" or "ubuntu\_dsvm\_ss". AzureVM comes with a number of supplied configurations to deploy commonly used images, which can be seen at `vm_config` and `vmss_config`. Any arguments in ... will be passed to the configuration, allowing you to customise the deployment.
- As a call to the `vm_config` or `vmss_config` functions, to deploy a custom VM image.
- As an object of class `vm_config` or `vmss_config`.

The data disks for the VM can be specified as either a vector of numeric disk sizes in GB, or as a list of `datadisk_config` objects, created via calls to the `datadisk_config` function. Currently, AzureVM only supports creating data disks at deployment time for single VMs, not scalesets.

You can also supply your own template definition and parameters for deployment, via the `template` and `parameters` arguments. See [AzureRMR::az\\_template](#) for information how to create templates.

The `AzureRMR::az_subscription` methods will by default create the VM in *exclusive* mode, meaning a new resource group is created solely to hold the VM or scaleset. This simplifies managing the VM considerably; in particular deleting the resource group will also automatically delete all the deployed resources.

### Value

For `create_vm`, an object of class `az_vm_template` representing the created VM. For `create_vm_scaleset`, an object of class `az_vmss_template` representing the scaleset.

## End(Not run)

```

---

defunct

*Defunct methods*

---

## Description

Defunct methods

## Usage

```

get_vm_cluster(...)
create_vm_cluster(...)

```

```
delete_vm_cluster(...)
```

These methods for the `az_subscription` and `az_resource_group` classes are defunct in AzureVM 2.0. To work with virtual machine clusters, call the [get\\_vm\\_scaleset](#), [create\\_vm\\_scaleset](#) and [delete\\_vm\\_scaleset](#) methods instead.

---

delete_vm	<i>Delete virtual machine</i>
-----------	-------------------------------

---

## Description

Method for the [AzureRMR::az\\_subscription](#) and [AzureRMR::az\\_resource\\_group](#) classes.

## Usage

```
## R6 method for class 'az_resource_group'
delete_vm(name, confirm = TRUE, free_resources = TRUE)

## R6 method for class 'az_subscription'
delete_vm(name, confirm = TRUE, free_resources = TRUE,
          resource_group = name)

## R6 method for class 'az_resource_group'
delete_vm_scaleset(name, confirm = TRUE, free_resources = TRUE)

## R6 method for class 'az_subscription'
delete_vm_scaleset(name, confirm = TRUE, free_resources = TRUE,
                  resource_group = name)
```

## Arguments

- `name`: The name of the VM or scaleset.
- `confirm`: Whether to confirm the delete.
- `free_resources`: If this was a deployed template, whether to free all resources created during the deployment process.
- `resource_group`: For the `AzureRMR::az_subscription` method, the resource group containing the VM or scaleset.

## Details

For the subscription methods, deleting the VM or scaleset will also delete its resource group.

## See Also

## Examples

```
## Not run:

sub <- AzureRMR::get_azure_login()$
  get_subscription("subscription_id")

sub$delete_vm("myvm")
sub$delete_vm_scaleset("myscaleset")

## End(Not run)
```

---

get_vm	<i>Get existing virtual machine(s)</i>
--------	----------------------------------------

---

## Description

Method for the [AzureRMR::az\\_subscription](#) and [AzureRMR::az\\_resource\\_group](#) classes.

## Usage

```
## R6 method for class 'az_subscription'
get_vm(name, resource_group = name)

## R6 method for class 'az_resource_group'
get_vm(name)

## R6 method for class 'az_subscription'
get_vm_scaleset(name, resource_group = name)

## R6 method for class 'az_resource_group'
get_vm_scaleset(name)

## R6 method for class 'az_resource_group')
get_vm_resource(name)
get_vm_scaleset_resource(name)
```

## Arguments

- name: The name of the VM or scaleset.
- resource\_group: For the az\_subscription methods, the resource group in which get\_vm() and get\_vm\_scaleset() will look for the VM or scaleset. Defaults to the VM name.

**Value**

For `get_vm()`, an object representing the VM deployment. This will include other resources besides the VM itself, such as the network interface, virtual network, etc.

For `get_vm_scaleset()`, an object representing the scaleset deployment. Similarly to `get_vm()`, this includes other resources besides the scaleset.

For `get_vm_resource()` and `get_vm_scaleset_resource()`, the VM or scaleset resource itself.

**See Also**

**Examples**

```
## Not run:

sub <- AzureRMR::get_azure_login()$
  get_subscription("subscription_id")

sub$get_vm("myvirtualmachine")
sub$get_vm_scaleset("myscaleset")

rg <- sub$get_resource_group("rgname")
rg$get_vm("myothervirtualmachine")
rg$get_vm_scaleset("myotherscaleset")

## End(Not run)
```

---

ip\_config

*Public IP address configuration*

---

**Description**

Public IP address configuration

**Usage**

```
ip_config(type = NULL, dynamic = NULL, ipv6 = FALSE,
  domain_name = "[parameters('vmName')]", ...)
```

**Arguments**

type	The SKU of the IP address resource: "basic" or "standard". If NULL (the default), this will be determined based on the VM's configuration.
dynamic	Whether the IP address should be dynamically or statically allocated. Note that the standard SKU only supports standard allocation. If NULL (the default) this will be determined based on the VM's configuration.
ipv6	Whether to create an IPv6 address. The default is IPv4.
domain_name	The domain name label to associate with the address.
...	Other named arguments that will be treated as resource properties.

**See Also**

[create\\_vm](#), [vm\\_config](#), [vmss\\_config](#)

**Examples**

```
ip_config()
ip_config(type="basic", dynamic=TRUE)

# if you don't want a domain name associated with the IP address
ip_config(domain_name=NULL)
```

---

is\_vm

---

*Is an object an Azure VM*

---

**Description**

Is an object an Azure VM

**Usage**

```
is_vm(object)

is_vm_template(object)

is_vm_resource(object)

is_vm_scaleset(object)

is_vm_scaleset_template(object)

is_vm_scaleset_resource(object)
```

**Arguments**

object            an R object.

**Value**

is\_vm and is\_vm\_template return TRUE for an object representing a virtual machine deployment (which will include other resources besides the VM itself).

is\_vm\_resource returns TRUE for an object representing the specific VM resource.

is\_vm\_scaleset and is\_vm\_scaleset\_template return TRUE for an object representing a VM scaleset deployment.

is\_vm\_scaleset\_resource returns TRUE for an object representing the specific VM scaleset resource.

**See Also**

---

 lb\_config

*Load balancer configuration*

---

**Description**

Load balancer configuration

**Usage**

```
lb_config(type = NULL, rules = list(), probes = list(), ...)
```

```
lb_probe(name, port, interval = 5, fail_on = 2, protocol = "Tcp")
```

```
lb_rule(name, frontend_port, backend_port = frontend_port,
        protocol = "Tcp", timeout = 5, floating_ip = FALSE, probe_name)
```

**Arguments**

type	The SKU of the load balancer resource: "basic" or "standard". If NULL (the default), this will be determined based on the VM scaleset's configuration. Note that the load balancer SKU must be the same as that of its public IP address.
rules	A list of load balancer rules, each obtained via a call to lb_rule.
probes	A list of health checking probes, each obtained via a call to lb_probe. There must be a probe corresponding to each rule.
...	Other named arguments that will be treated as resource properties.
name	For lb_rule, a name for the load balancing rule.
port	For lb_probe, the port to probe.
interval	For lb_probe, the time interval between probes in seconds.
fail_on	For lb_probe, the probe health check will fail after this many non-responses.
protocol	For lb_probe and lb_rule, the protocol: either "Tcp" or "Ip".

frontend_port, backend_port	For lb_rule, the ports for this rule.
timeout	The timeout interval for the rule. The default is 5 minutes.
floating_ip	Whether to use floating IP addresses (direct server return). Only needed for specific scenarios, and when the frontend and backend ports don't match.
probe_name	The name of the corresponding health check probe.

**See Also**

[create\\_vm\\_scaleset](#), [vmss\\_config](#), [lb\\_rules](#) for some predefined load balancing rules and probes

**Examples**

```
lb_config()
lb_config(type="basic")
lb_config(
    rules=list(lb_rule_ssh, lb_rule_rdp),
    probes=list(lb_probe_ssh, lb_probe_rdp)
)
```

---

lb_rule_ssh	<i>Load balancing rules</i>
-------------	-----------------------------

---

**Description**

Load balancing rules

**Usage**

```
lb_rule_ssh
lb_rule_http
lb_rule_https
lb_rule_rdp
lb_rule_jupyter
lb_rule_rstudio
lb_rule_mssql
lb_rule_mssql_browser
lb_probe_ssh
```

lb\_probe\_http  
lb\_probe\_https  
lb\_probe\_rdp  
lb\_probe\_jupyter  
lb\_probe\_rstudio  
lb\_probe\_mssql  
lb\_probe\_mssql\_browser

### Format

Objects of class lb\_rule and lb\_probe.

### Details

Some predefined load balancing objects, for commonly used ports. Each load balancing rule comes with its own health probe.

- HTTP: TCP port 80
- HTTPS: TCP port 443
- JupyterHub: TCP port 8000
- RDP: TCP port 3389
- RStudio Server: TCP port 8787
- SSH: TCP port 22
- SQL Server: TCP port 1433
- SQL Server browser service: TCP port 1434

### See Also

[lb\\_config](#)

---

list\_vm\_sizes

*List available VM sizes*

---

### Description

Method for the [AzureRMR::az\\_subscription](#) and [AzureRMR::az\\_resource\\_group](#) classes.

**Usage**

```
## R6 method for class 'az_subscription'  
list_vm_sizes(location, name_only = FALSE)  
  
## R6 method for class 'az_resource_group'  
list_vm_sizes(name_only = FALSE)
```

**Arguments**

- `location`: For the subscription class method, the location/region for which to obtain available VM sizes.
- `name_only`: Whether to return only a vector of names, or all information on each VM size.

**Value**

If `name_only` is TRUE, a character vector of names, suitable for passing to `create_vm`. If FALSE, a data frame containing the following information for each VM size: the name, number of cores, OS disk size, resource disk size, memory, and maximum data disks.

**See Also**

[create\\_vm](#)

**Examples**

```
## Not run:  
  
sub <- AzureRMR::get_azure_login$  
  get_subscription("subscription_id")  
  
sub$list_vm_sizes("australiaeast")  
  
# same output as above  
rg <- sub$create_resource_group("rgname", location="australiaeast")  
rg$list_vm_sizes()  
  
## End(Not run)
```

---

nic\_config

*Network interface configuration*

---

**Description**

Network interface configuration

**Usage**

```
nic_config(nic_ip = list(nic_ip_config()), ...)

nic_ip_config(name = "ipconfig", private_alloc = "dynamic",
  subnet = "[variables('subnetId')]",
  public_address = "[variables('ipId')]", ...)
```

**Arguments**

nic_ip	For nic_config, a list of IP configuration objects, each obtained via a call to nic_ip_config.
...	Other named arguments that will be treated as resource properties.
name	For nic_ip_config, the name of the IP configuration.
private_alloc	For nic_ip_config, the allocation method for a private IP address. Can be "dynamic" or "static".
subnet	For nic_ip_config, the subnet to associate with this private IP address.
public_address	For nic_ip_config, the public IP address. Defaults to the public IP address created or used as part of this VM deployment. Ignored if the deployment does not include a public address.

**See Also**

[create\\_vm](#), [vm\\_config](#)

**Examples**

```
nic_config()
```

---

nsg\_config

*Network security group configuration*

---

**Description**

Network security group configuration

**Usage**

```
nsg_config(rules = list(), ...)

nsg_rule(name, dest_port = "*", dest_addr = "*", dest_asgs = NULL,
  source_port = "*", source_addr = "*", source_asgs = NULL,
  access = "allow", direction = "inbound", protocol = "Tcp",
  priority = NULL)
```

**Arguments**

rules	for nsg_config, a list of security rule objects, each obtained via a call to nsg_rule.
...	Other named arguments that will be treated as resource properties.
name	For nsg_rule, a name for the rule.
dest_port, dest_addr, dest_asgs	For nsg_rule, the destination port, address range, and application security groups for a rule.
source_port, source_addr, source_asgs	For nsg_rule, the source port, address range, and application security groups for a rule.
access	For nsg_rule, the action to take: "allow" or "deny".
direction	For nsg_rule, the direction of traffic: "inbound" or "outbound".
protocol	For nsg_rule, the network protocol: either "Tcp" or "Udp".
priority	For nsg_rule, the rule priority. If NULL, this will be set automatically by AzureVM.

**See Also**

[create\\_vm](#), [vm\\_config](#), [vmss\\_config](#), [nsg\\_rules](#) for some predefined security rules

**Examples**

```
nsg_config()
nsg_config(list(nsg_rule_allow_ssh)) # for Linux
nsg_config(list(nsg_rule_allow_rdp)) # for Windows
nsg_config(list(nsg_rule_allow_http, nsg_rule_allow_https))

# a custom rule
nsg_config(list(
  nsg_rule(
    name="whitelist",
    source_addr="114.198.100.0/24",
    access="allow",
    protocol="*"
  )
))
```

---

nsg\_rule\_allow\_ssh      *Network security rules*

---

**Description**

Network security rules

## **Usage**

`nsg_rule_allow_ssh`  
`nsg_rule_allow_http`  
`nsg_rule_allow_https`  
`nsg_rule_allow_rdp`  
`nsg_rule_allow_jupyter`  
`nsg_rule_allow_rstudio`  
`nsg_rule_allow_mssql`  
`nsg_rule_allow_mssql_browser`

## **Format**

Objects of class `nsg_rule`.

## **Details**

Some predefined network security rule objects, to unblock commonly used ports.

- HTTP: TCP port 80
- HTTPS: TCP port 443
- JupyterHub: TCP port 8000
- RDP: TCP port 3389
- RStudio Server: TCP port 8787
- SSH: TCP port 22
- SQL Server: TCP port 1433
- SQL Server browser service: TCP port 1434

## **See Also**

[nsg\\_config](#)

---

scaleset_options	<i>Virtual machine scaleset options</i>
------------------	-----------------------------------------

---

## Description

Virtual machine scaleset options

## Usage

```
scaleset_options(keylogin = TRUE, managed_identity = TRUE,
  public = FALSE, low_priority = FALSE, delete_on_evict = FALSE,
  network_accel = FALSE, large_scaleset = FALSE,
  overprovision = TRUE, upgrade_policy = list(mode = "manual"),
  os_disk_type = c("Premium_LRS", "StandardSSD_LRS", "Standard_LRS"))
```

## Arguments

keylogin	Whether to use an SSH public key to login (TRUE) or a password (FALSE). Note that Windows does not support SSH key logins.
managed_identity	Whether to provide a managed system identity for the VM.
public	Whether the instances (nodes) of the scaleset should be visible from the public internet.
low_priority	Whether to use low-priority VMs. Note that this option is only available for certain VM sizes.
delete_on_evict	If low-priority VMs are being used, whether evicting (shutting down) a VM should delete it, as opposed to just deallocating it.
network_accel	Whether to enable accelerated networking. This option is only available for certain VM sizes.
large_scaleset	Whether to enable scaleset sizes > 100 instances.
overprovision	Whether to overprovision the scaleset on creation.
upgrade_policy	A list, giving the VM upgrade policy for the scaleset.
os_disk_type	The type of primary disk for the VM. Change this to "StandardSSD_LRS" or "Standard_LRS" if the VM size doesn't support premium storage.

---

user\_config                      *Resource configuration functions for a virtual machine deployment*

---

## Description

Resource configuration functions for a virtual machine deployment

## Usage

```
user_config(username, sshkey = NULL, password = NULL)
```

```
datadisk_config(size, name = "datadisk", create = "empty",
  type = c("StandardSSD_LRS", "Premium_LRS", "Standard_LRS",
  "UltraSSD_LRS"), write_accelerator = FALSE)
```

```
image_config(publisher = NULL, offer = NULL, sku = NULL,
  version = "latest", id = NULL)
```

## Arguments

username	For user_config, the name for the admin user account.
sshkey	For user_config, string containing an SSH public key. Can be the key itself, or the name of the public key file.
password	For user_config, the admin password. Supply either sshkey or password, but not both; also, note that Windows does not support SSH logins.
size	For datadisk_config, the size of the data disk in GB. Set this to NULL for a disk that will be created from an image.
name	For datadisk_config, the disk name. Duplicate names will automatically be disambiguated prior to VM deployment.
create	For datadisk_config, the creation method. Can be "empty" (the default) to create a blank disk, or "fromImage" to use an image.
type	For datadisk_config, the disk type (SKU). Can be "Standard_LRS", "StandardSSD_LRS" (the default), "Premium_LRS" or "UltraSSD_LRS". Of these, "Standard_LRS" uses hard disks and the others use SSDs as the underlying hardware.
write_accelerator	For datadisk_config, whether the disk should have write acceleration enabled.
publisher, offer, sku, version	For image_config, the details for a marketplace image.
id	For image_config, the resource ID for a disk to use as a custom image.

  nsg = nsg_config(list(nsg_rule_allow_ssh)),
  load_balancer = lb_config(rules = list(lb_rule_ssh), probes =
    list(lb_probe_ssh)), ...)

```

### Arguments

image	For vmss_config, the VM image to deploy. This should be an object of class image_config, created by the function of the same name.
options	Scaleset options, as obtained via a call to scaleset_options.
datadisks	The data disks to attach to the VM. Specify this as either a vector of numeric disk sizes in GB, or a list of datadisk_config objects for more control over the specification.
nsg	The network security group for the scaleset. Can be a call to nsg_config to create a new NSG; an AzureRMR resource object or resource ID to reuse an existing NSG; or NULL to not use an NSG (not recommended).
vnet	The virtual network for the scaleset. Can be a call to vnet_config to create a new virtual network, or an AzureRMR resource object or resource ID to reuse an existing virtual network. Note that by default, AzureVM will associate the NSG with the virtual network/subnet, not with the VM's network interface.
load_balancer	The load balancer for the scaleset. Can be a call to lb_config to create a new load balancer; an AzureRMR resource object or resource ID to reuse an existing load balancer; or NULL if load balancing is not required.

load_balancer_address	The public IP address for the load balancer. Can be a call to <code>ip_config</code> to create a new IP address, or an AzureRMR resource object or resource ID to reuse an existing address resource. Ignored if <code>load_balancer</code> is NULL.
autoscaler	The autoscaler for the scaleset. Can be a call to <code>autoscaler_config</code> to create a new autoscaler; an AzureRMR resource object or resource ID to reuse an existing autoscaler; or NULL if autoscaling is not required.
other_resources	An optional list of other resources to include in the deployment.
variables	An optional named list of variables to add to the template.
...	For the specific VM configurations, other customisation arguments to be passed to <code>vm_config</code> . For <code>vmss_config</code> , named arguments that will be folded into the scaleset resource definition in the template.
dsvm_disk_type	The Ubuntu DSVM image comes with one additional datadisk that holds some installed tools. This argument sets what type of disk is used. Change this to "StandardSSD_LRS" or "Standard_LRS" if the VM size doesn't support premium storage.

## Details

These functions are for specifying the details of a new virtual machine scaleset deployment: the base VM image and related options, along with the Azure resources that the scaleset may need. These include the network security group, virtual network, load balancer and associated public IP address, and autoscaler.

Each resource can be specified in a number of ways:

- To *create* a new resource as part of the deployment, call the corresponding `*_config` function.
- To use an *existing* resource, supply either an AzureRMR: `:az_resource` object (recommended) or a string containing the resource ID.
- If the resource is not needed, specify it as NULL.
- For the `other_resources` argument, supply a list of resources, each of which should be a list of resource fields (name, type, properties, sku, etc).

The `vmss_config` function is the base configuration function, and the others call it to create VM scalesets with specific operating systems and other image details.

- `ubuntu_dsvm_ss`: Data Science Virtual Machine, based on Ubuntu 16.04
- `windows_dsvm_ss`: Data Science Virtual Machine, based on Windows Server 2016
- `ubuntu_16.04_ss`, `ubuntu_18.04`: Ubuntu LTS
- `windows_2016_ss`, `windows_2019`: Windows Server Datacenter edition
- `rhel_7.6_ss`, `rhel_8_ss`: Red Hat Enterprise Linux
- `centos_7.5_ss`, `centos_7.6_ss`: CentOS
- `debian_8_backports_ss`, `debian_9_backports_ss`: Debian with backports

A VM scaleset configuration defines the following template variables by default, depending on its resources. If a particular resource is created, the corresponding `*Name`, `*Id` and `*Ref` variables will be available. If a resource is referred to but not created, the `*Name*` and `*Id` variables will be available. Other variables can be defined via the `variables` argument.

Variable name	Contents
location	[resourceGroup().location]
vmId	[resourceId('Microsoft.Compute/virtualMachines', parameters('vmName'))]
vmRef	[concat('Microsoft.Compute/virtualMachines/', parameters('vmName'))]
nsgName	[concat(parameters('vmName'), '-nsg')]
nsgId	[resourceId('Microsoft.Network/networkSecurityGroups', variables('nsgName'))]
nsgRef	[concat('Microsoft.Network/networkSecurityGroups/', variables('nsgName'))]
vnetName	[concat(parameters('vmName'), '-vnet')]
vnetId	[resourceId('Microsoft.Network/virtualNetworks', variables('vnetName'))]
vnetRef	[concat('Microsoft.Network/virtualNetworks/', variables('vnetName'))]
subnet	subnet
subnetId	[concat(variables('vnetId'), '/subnets/', variables('subnet'))]
lbName	[concat(parameters('vmName'), '-lb')]
lbId	[resourceId('Microsoft.Network/loadBalancers', variables('lbName'))]
lbRef	[concat('Microsoft.Network/loadBalancers/', variables('lbName'))]
lbFrontendName	frontend
lbBackendName	backend
lbFrontendId	[concat(variables('lbId'), '/frontendIPConfigurations/', variables('lbFrontendName'))]
lbBackendId	[concat(variables('lbId'), '/backendAddressPools/', variables('lbBackendName'))]
ipName	[concat(parameters('vmName'), '-ip')]
ipId	[resourceId('Microsoft.Network/publicIPAddresses', variables('ipName'))]
ipRef	[concat('Microsoft.Network/publicIPAddresses/', variables('ipName'))]
asName	[concat(parameters('vmName'), '-as')]
asId	[resourceId('Microsoft.Insights/autoscaleSettings', variables('asName'))]
asRef	[concat('Microsoft.Insights/autoscaleSettings/', variables('asName'))]
asMaxCapacity	[mul(int(parameters('instanceCount')), 10)]
asScaleValue	[max(div(int(parameters('instanceCount')), 5), 1)]

Thus, for example, if you are creating a VM scaleset named "myvmss" along with all its associated resources, the NSG is named "myvmss-nsg", the virtual network is "myvmss-vnet", the load balancer is "myvmss-lb", the public IP address is "myvmss-ip", and the autoscaler is "myvm-as".

### Value

An object of S3 class `vmss_config`, that can be used by the `create_vm_scaleset` method.

### See Also

[scaleset\\_options](#) for options relating to the scaleset resource itself  
[nsg\\_config](#), [ip\\_config](#), [vnet\\_config](#), [lb\\_config](#), [autoscaler\\_config](#) for other resource configs  
[build\\_template](#) for template builder methods  
[vm\\_config](#) for configuring an individual virtual machine  
[create\\_vm\\_scaleset](#)

### Examples

```
# basic Linux (Ubuntu) and Windows configs
```

```

ubuntu_18.04_ss()
windows_2019_ss()

# Windows Dsvm scaleset, no load balancer and autoscaler
windows_dsvm_ss(load_balancer=NULL, autoscaler=NULL)

# RHEL VM exposing ports 80 (HTTP) and 443 (HTTPS)
rhel_8_ss(nsg=nsg_config(nsg_rule_allow_http, nsg_rule_allow_https))

# exposing no ports externally
rhel_8_ss(nsg=nsg_config(list()))

# low-priority VMs, large scaleset (>100 instances allowed), no managed identity
rhel_8_ss(options=scaleset_options(low_priority=TRUE, large_scaleset=TRUE, managed_identity=FALSE))

## Not run:

# reusing existing resources: placing a scaleset in an existing vnet/subnet
# we don't need a new network security group either
vnet <- AzureRMR::get_azure_login()$
  get_subscription("sub_id")$
  get_resource_group("rgname")$
  get_resource(type="Microsoft.Network/virtualNetworks", name="myvnet")

ubuntu_18.04_ss(vnet=vnet, nsg=NULL)

## End(Not run)

```

  ...)  
  
debian_8_backports(keylogin = TRUE, managed_identity = TRUE,  
  datadisks = numeric(0), nsg = nsg_config(list(nsg_rule_allow_ssh)),  
  ...)  
  
debian_9_backports(keylogin = TRUE, managed_identity = TRUE,  
  datadisks = numeric(0), nsg = nsg_config(list(nsg_rule_allow_ssh)),  
  ...)
```

## Arguments

image	For vm_config, the VM image to deploy. This should be an object of class image_config, created by the function of the same name.
keylogin	Whether to use an SSH public key to login (TRUE) or a password (FALSE). Note that Windows does not support SSH key logins.
managed_identity	Whether to provide a managed system identity for the VM.
os_disk_type	The type of primary disk for the VM. Can be "Premium_LRS" (the default), "StandardSSD_LRS", or "Standard_LRS". Of these, "Standard_LRS" uses hard disks and the others use SSDs as the underlying hardware. Change this to "StandardSSD_LRS" or "Standard_LRS" if the VM size doesn't support premium storage.
datadisks	The data disks to attach to the VM. Specify this as either a vector of numeric disk sizes in GB, or a list of datadisk_config objects for more control over the specification.
nsg	The network security group for the VM. Can be a call to nsg_config to create a new NSG; an AzureRMR resource object or resource ID to reuse an existing NSG; or NULL to not use an NSG (not recommended).
ip	The public IP address for the VM. Can be a call to ip_config to create a new IP address; an AzureRMR resource object or resource ID to reuse an existing address resource; or NULL if the VM should not be accessible from outside its subnet.
vnet	The virtual network for the VM. Can be a call to vnet_config to create a new virtual network, or an AzureRMR resource object or resource ID to reuse an existing virtual network. Note that by default, AzureVM will associate the NSG with the virtual network/subnet, not with the VM's network interface.
nic	The network interface for the VM. Can be a call to nic_config to create a new interface, or an AzureRMR resource object or resource ID to reuse an existing interface.
other_resources	An optional list of other resources to include in the deployment.
variables	An optional named list of variables to add to the template.
...	For the specific VM configurations, other customisation arguments to be passed to vm_config. For vm_config, named arguments that will be folded into the VM resource definition in the template.
dsvm_disk_type	The Ubuntu DSVN image comes with one additional datadisk that holds some installed tools. This argument sets what type of disk is used. Change this to "StandardSSD_LRS" or "Standard_LRS" if the VM size doesn't support premium storage.

## Details

These functions are for specifying the details of a new virtual machine deployment: the VM image and related options, along with the Azure resources that the VM may need. These include the datadisks, network security group, public IP address (if the VM is to be accessible from outside its

subnet), virtual network, and network interface. `vm_config` is the base configuration function, and the others call it to create VMs with specific operating systems and other image details.

- `ubuntu_dsvm`: Data Science Virtual Machine, based on Ubuntu 16.04
- `windows_dsvm`: Data Science Virtual Machine, based on Windows Server 2016
- `ubuntu_16.04`, `ubuntu_18.04`: Ubuntu LTS
- `windows_2016`, `windows_2019`: Windows Server Datacenter edition
- `rhel_7.6`, `rhel_8`: Red Hat Enterprise Linux
- `centos_7.5`, `centos_7.6`: CentOS
- `debian_8_backports`, `debian_9_backports`: Debian with backports

Each resource can be specified in a number of ways:

- To *create* a new resource as part of the deployment, call the corresponding `*_config` function.
- To use an *existing* resource, supply either an AzureRMR: `: az_resource` object (recommended) or a string containing the resource ID.
- If the resource is not needed, specify it as `NULL`.
- For the `other_resources` argument, supply a list of resources, each of which should be a list of resource fields (name, type, properties, sku, etc).

A VM configuration defines the following template variables by default, depending on its resources. If a particular resource is created, the corresponding `*Name`, `*Id` and `*Ref` variables will be available. If a resource is referred to but not created, the `*Name*` and `*Id` variables will be available. Other variables can be defined via the `variables` argument.

Variable name	Contents	Description
<code>location</code>	<code>[resourceGroup().location]</code>	Region to deploy
<code>vmId</code>	<code>[resourceId('Microsoft.Compute/virtualMachines', parameters('vmName'))]</code>	VM resource ID
<code>vmRef</code>	<code>[concat('Microsoft.Compute/virtualMachines/', parameters('vmName'))]</code>	VM template ID
<code>nsgName</code>	<code>[concat(parameters('vmName'), '-nsg')]</code>	Network Security Group name
<code>nsgId</code>	<code>[resourceId('Microsoft.Network/networkSecurityGroups', variables('nsgName'))]</code>	NSG resource ID
<code>nsgRef</code>	<code>[concat('Microsoft.Network/networkSecurityGroups/', variables('nsgName'))]</code>	NSG template ID
<code>ipName</code>	<code>[concat(parameters('vmName'), '-ip')]</code>	Public IP name
<code>ipId</code>	<code>[resourceId('Microsoft.Network/publicIPAddresses', variables('ipName'))]</code>	IP resource ID
<code>ipRef</code>	<code>[concat('Microsoft.Network/publicIPAddresses/', variables('ipName'))]</code>	IP template ID
<code>vnetName</code>	<code>[concat(parameters('vmName'), '-vnet')]</code>	Virtual network name
<code>vnetId</code>	<code>[resourceId('Microsoft.Network/virtualNetworks', variables('vnetName'))]</code>	Vnet resource ID
<code>vnetRef</code>	<code>[concat('Microsoft.Network/virtualNetworks/', variables('vnetName'))]</code>	Vnet template ID
<code>subnet</code>	<code>subnet</code>	Subnet name
<code>subnetId</code>	<code>[concat(variables('vnetId'), '/subnets/', variables('subnet'))]</code>	Subnet resource ID
<code>nicName</code>	<code>[concat(parameters('vmName'), '-nic')]</code>	Network interface name
<code>nicId</code>	<code>[resourceId('Microsoft.Network/networkInterfaces', variables('nicName'))]</code>	NIC resource ID
<code>nicRef</code>	<code>[concat('Microsoft.Network/networkInterfaces/', variables('nicName'))]</code>	NIC template ID

Thus, for example, if you are creating a VM named "myvm" along with all its associated resources, the NSG is named "myvm-nsg", the public IP address is "myvm-ip", the virtual network is "myvm-vnet", and the network interface is "myvm-nic".

**Value**

An object of S3 class `vm_config`, that can be used by the `create_vm` method.

**See Also**

[image\\_config](#), [user\\_config](#), [datadisk\\_config](#) for options relating to the VM resource itself

[build\\_template](#) for template builder methods

[vmss\\_config](#) for configuring a virtual machine scaleset

[create\\_vm](#)

**Examples**

```
# basic Linux (Ubuntu) and Windows configs
ubuntu_18.04()
windows_2019()

# Windows DSVM with 500GB data disk, no public IP address
windows_dsvm(datadisks=500, ip=NULL)

# RHEL VM exposing ports 80 (HTTP) and 443 (HTTPS)
rhel_8(nsg=nsg_config(nsg_rule_allow_http, nsg_rule_allow_https))

# exposing no ports externally
rhel_8(nsg=nsg_config(list()))

# deploying an extra resource: storage account
ubuntu_18.04(
  variables=list(storName="[concat(parameters('vmName'), 'stor')]"),
  other_resources=list(
    list(
      type="Microsoft.Storage/storageAccounts",
      name="[variables('storName')]",
      apiVersion="2018-07-01",
      location="[variables('location')]",
      properties=list(supportsHttpsTrafficOnly=TRUE),
      sku=list(name="Standard_LRS"),
      kind="Storage"
    )
  )
)

## custom VM configuration: Windows 10 Pro 1903 with data disks
## this assumes you have a valid Win10 desktop license
user <- user_config("myname", password="Use-strong-passwords!")
image <- image_config(
  publisher="MicrosoftWindowsDesktop",
  offer="Windows-10",
  sku="19h1-pro"
```

```

)
datadisks <- list(
  datadisk_config(250, type="Premium_LRS"),
  datadisk_config(1000, type="Standard_LRS")
)
nsg <- nsg_config(
  list(nsg_rule_allow_rdp)
)
vm_config(
  image=image,
  keylogin=FALSE,
  datadisks=datadisks,
  nsg=nsg,
  properties=list(licenseType="Windows_Client")
)

## Not run:

# reusing existing resources: placing multiple VMs in one vnet/subnet
rg <- AzureRMR::get_azure_login()$
  get_subscription("sub_id")$
  get_resource_group("rgname")

vnet <- rg$get_resource(type="Microsoft.Network/virtualNetworks", name="myvnet")

# by default, the NSG is associated with the subnet, so we don't need a new NSG either
vmconfig1 <- ubuntu_18.04(vnet=vnet, nsg=NULL)
vmconfig2 <- debian_9_backports(vnet=vnet, nsg=NULL)
vmconfig3 <- windows_2019(vnet=vnet, nsg=NULL)

## End(Not run)

```

---

vnet\_config

*Virtual network configuration*

---

## Description

Virtual network configuration

## Usage

```

vnet_config(address_space = "10.0.0.0/16",
  subnets = list(subnet_config()), ...)

subnet_config(name = "subnet", addresses = "10.0.0.0/16",
  nsg = "[variables('nsgId')]", ...)

```

**Arguments**

address_space	For vnet_config, the address range accessible by the virtual network, expressed in CIDR block format.
subnets	For vnet_config, a list of subnet objects, each obtained via a call to subnet_config.
...	Other named arguments that will be treated as resource properties.
name	For subnet_config, the name of the subnet. Duplicate names will automatically be disambiguated prior to VM deployment.
addresses	For subnet_config, the address ranges spanned by this subnet. Must be a subset of the address space available to the parent virtual network.
nsg	The network security group associated with this subnet. Defaults to the NSG created as part of this VM deployment.

**See Also**

[create\\_vm](#), [vm\\_config](#), [vmss\\_config](#)

**Examples**

```
vnet_config()  
vnet_config(address_space="10.1.0.0/16")  
vnet_config(subnets=list(  
    subnet_config("subnet", "10.0.0.0/24")  
))
```
